POLYMERIC SUFACTANT-ENCAPSULATED MICROBUBBLES AND THEIR USE IN ULTRASOUND IMAGING.

This invention relates to novel contrast agents,
5 more particularly to gas-containing contrast agents of
use in diagnostic imaging, and to novel polymers useful
in their manufacture.

It is well known that ultrasonic imaging comprises
a potentially valuable diagnostic tool, for example in
10 studies of the vascular system, particularly in
cardiography, and of tissue microvasculature. A variety
of contrast agents has been proposed to enhance the
acoustic images so obtained, including suspensions of
solid particles, emulsified liquid droplets, gas bubbles
15 and encapsulated gases or liquids. It is generally
accepted that low density contrast agents which are
easily compressible are particularly efficient in terms
of the acoustic backscatter they generate, and
considerable interest has therefore been shown in the
20 preparation of gas-containing and gas-generating
systems.

Gas-containing contrast media are also known to be
effective in magnetic resonance (MR) imaging, e.g. as
susceptibility contrast agents which will act to reduce
25 MR signal intensity. Oxygen-containing contrast media
also represent potentially useful paramagnetic MR
contrast agents.

Furthermore, in the field of X-ray imaging it has
been observed that gases such as carbon dioxide may be
30 used as negative oral contrast agents.

Initial studies involving free gas bubbles
generated in vivo by intracardiac injection of
physiologically acceptable substances have demonstrated
the potential efficiency of such bubbles as contrast
35 agents in echocardiography; such techniques are severely
limited in practice, however, by the short lifetime of

- 2 -

the free bubbles. Interest has accordingly been shown in methods of stabilising gas bubbles for echocardiography and other ultrasonic studies, for example using emulsifiers, oils, thickeners or sugars, or by entraining or encapsulating the gas or a precursor therefor in a variety of polymer systems, e.g. as gas-containing polymer microparticles.

Thus, for example, WO 80/02365 discloses the use of gelatin encapsulated gas microbubbles for enhancing ultrasonic images. Such microbubbles do not, however, exhibit adequate stability at the dimensions preferred for use in echocardiography (1-10 μm) in view of the thinness of the encapsulating coating.

US-A-4774958 discloses the use of microbubble dispersions stabilised by encapsulation in denatured protein, e.g. human serum albumin. Such systems permit the production of microbubble systems having a size of e.g. 2-5 μm but still do not permit efficient visualisation of the left heart and myocardium. The use of such protein-derived agents may also create problems with regard to potential allergenic reactions.

EP-A-0327490 discloses, *inter alia*, ultrasonic contrast agents comprising a microparticulate synthetic biodegradable polymer containing a gas or volatile fluid (i.e. having a boiling point below 60°C) in free or bonded form. Representative synthetic biodegradable polymers include polyesters of hydroxy carbonic acids, polyalkyl cyanoacrylates, polyamino acids, polyamides, polyacrylated saccharides and polyorthoesters.

Similar biodegradable microparticulate polymers, based on polymerised aldehydes, are described in EP-A-0441468, while systems based on microparticulate poly (amino acid) - poly (cyclic imide) derivatives are described in EP-A-0458079.

Ultrasonic contrast agents consisting of microparticles consisting of amyloses or synthetic biodegradable polymers and a gas or volatile fluid are

- 3 -

described in WO 89/06978.

EP-A-0458745 discloses air or gas-filled microballoons in which the encapsulating material is a deformable and resilient interfacially deposited polymer which is preferably biodegradable, examples including polysaccharides, polyamino acids, polylactides, polyglycolides, lactide/lactone copolymers, polypeptides, proteins, polyorthoesters, polydioxanone, poly- β -aminoketones, polyphosphazenes, polyanhydrides and poly (alkyl cyanoacrylates). The microballoons are normally prepared by emulsion techniques leading to deposition of the polymer around droplets of a volatile liquid which is subsequently evaporated. Such techniques generally involve the use of surfactants, for example lecithins, fatty acids or esters thereof with polyoxyalkylene compounds such as polyoxyethylene glycol or polyoxypropylene glycol, in order to stabilise the emulsion.

It is generally acknowledged that polymer-based contrast agents should desirably be biodegradable in order to facilitate their ultimate elimination from or absorption by the test subject. In many instances it has therefore been proposed to use polymers such as polyesters, polyanhydrides, polycarbonates, polyamides and polyurethanes which are biodegradable as a result of the susceptibility of ester, amide or urethane groups therein to enzymic hydrolysis in vivo.

In our published International Patent Application No. WO 93/17718 there are described polymer-based contrast agents which are designed to exhibit high and controllable levels of biodegradability in vivo by virtue of the presence in the polymer of methylene diester units of formula

(where R^1 and R^2 each represent a hydrogen atom or a

- 4 -

carbon-attached monovalent organic group or R^1 and R^2 together form a carbon-attached divalent organic group and m and n are each zero or 1). Such units are particularly rapidly degraded by common esterase enzymes
5 but are relatively stable in the absence of enzymes.

These polymers may be formulated into microparticle- and/or microballoon-containing contrast agents by, for example, emulsion techniques such as those described in the above-mentioned EP-A-0458745. It
10 will normally be necessary for a dispersing agent, e.g. a surfactant, to be present during such processing; provided that the surfactant is physiologically acceptable it may, if desired, be retained in the final product, for example to enhance the dispersibility
15 and/or stability of the contrast agent microparticles and/or microballoons in the intended carrier medium.

WO 92/17212 describes polymer-based contrast agents comprising microbubbles of gas or a gas precursor encapsulated by non-proteinaceous crosslinked or
20 polymerised amphiphilic moieties, which may if desired contain methylene diester units of formula (I) as described above. These contrast agents may, for example, be prepared by emulsifying a polymerisable amphiphile, e.g. so as to yield an oil-in-water emulsion
25 in which a volatile water-immiscible organic solvent is encapsulated by the amphiphilic moieties, e.g. in the form of micelles, and thereafter crosslinking or polymerising the amphiphilic moieties and, if desired, removing the volatile organic solvent, e.g. by
30 evaporation. It will be appreciated that the surface active properties of the polymerisable amphiphiles may render unnecessary the use of extraneous surfactants in the emulsification procedures of such processes. The polymerisable amphiphiles may, for example, themselves
35 contain polymer groupings, e.g. hydrophilic polymer groups such as polyoxyethylene chains, as well as polymerisable groupings, e.g. (meth)acrylic or other

- 5 -

polymerisable alkenyl or alkynyl groups, and hydrophobic groups such as long chain alkyl groups.

The present invention is based on the finding that polymer-based gas-containing contrast agents in which microbubbles of gas are encapsulated by non-polymerisable wall-forming block or graft copolymer surfactants possess a number of advantageous properties. Thus such contrast agents may exhibit excellent storage stability and good stability and contrast effect in vivo following administration, often for several passages of circulation in the case of administration by intravenous injection; they can be designed to undergo rapid biodegradation thereafter. Moreover, it is possible by selection of the nature and size of the various regions or domains of the block or graft copolymer to influence properties of the contrast agents such as their stability, dispersibility, biological properties etc.

The fact that contrast agents according to the invention may readily and easily be prepared directly from block or graft copolymer surfactants, e.g. as described hereinafter, is also advantageous. Thus the use of prepolymerised wall-forming copolymer surfactant starting materials avoids the need for crosslinking or polymerisation reactions, e.g. as are described in WO 92/17212, with the attendant need subsequently to remove by-products and/or residues from materials such as initiators from the products in order to render them physiologically acceptable; contrast agents obtained directly from polymer starting materials may also exhibit greater structural integrity than contrast agents obtained by crosslinking or polymerisation reactions. Furthermore, as a result of the surface active properties of the block or graft copolymer surfactant starting materials, it is possible to prepare contrast agents according to the invention by emulsification techniques without using extraneous surfactants/emulsifiers, although as will be described

- 6 -

hereinafter use of such emulsifiers is not precluded where desired in specific embodiments of the invention.

According to one aspect of the present invention there is provided a contrast agent comprising gas
5 microbubbles encapsulated by a non-polymerisable wall-forming block or graft copolymer surfactant.

The term "non-polymerisable" as used herein in respect of the copolymer surfactant indicates that this material will not normally undergo further
10 polymerisation e.g. during preparation or use of contrast agents according to the invention. It will be appreciated that the copolymer surfactant may, however, be capable of further polymerisation reactions under more extreme conditions than will be encountered in such
15 circumstances.

The term "wall-forming" as used herein in respect of the copolymer surfactant indicates that this material is inherently capable of interacting to form an encapsulating structure having a desired degree of
20 integrity without requiring chemical reactions such as crosslinking or further polymerisation to stabilise the structure. Such structures may, for example, take the form of solid microparticles, e.g. comprising one or more encapsulated gas microbubbles, or membranes or
25 films encapsulating gas microbubbles dispersed in a liquid carrier.

The surfactant properties of copolymers used in contrast agents according to the invention will normally arise from the presence in the copolymer of separate
30 regions or domains having different lyophilicity. Most commonly one or more such regions or domains will be hydrophilic and one or more other regions or domains will be hydrophobic, such that the copolymer exhibits amphiphilic properties. It may, however, also be
35 possible to use copolymers containing separate regions or domains exhibiting, for example, differing degrees of hydrophilicity.

- 7 -

Block copolymer surfactants which may be used in contrast agents according to the invention include block copolymers having two or more blocks of differing lyophilicity, for example in linear di-block, tri-block or multi-block arrays, e.g. of the type A-B, A-B-A, B-A-B or A-B-A-B-A-B where A and B are polymer blocks of differing lyophilicity, e.g. hydrophilic and hydrophobic blocks respectively. Branched structures, e.g. of the type

and macrocyclic structures, e.g. of the type

may also be employed.

The size of one or other type of block may if desired be chosen to be relatively small in order to obtain a desired hydrophilic/lipophilic balance. Thus, for example, in the case of block copolymers containing hydrophilic and hydrophobic blocks it may be advantageous to select small-sized hydrophobic blocks in order to render the copolymer water-soluble.

In general where small-sized blocks are present these may include both oligomeric groups and quasi-polymeric groups, including monomeric groups, which may for example exhibit polymer characteristics (e.g. as a result of the presence of long chain units) while not strictly possessing a definable repeating unit. Copolymers containing such oligomeric or quasi-polymeric blocks are sometimes described in the art as "extended polymers". One category of such extended polymers useful in contrast agents according to the invention comprises hydrophilic polymer blocks linked by oligomeric or quasi-polymeric hydrophobic regions or

- 8 -

domains.

Graft copolymer surfactants which may be used in contrast agents according to the invention will normally comprise a first polymer having branches of a second
5 polymer of different lyophilicity along its length; if desired either the first or second polymer may be a block copolymer, in which case the surfactant may be termed a block-graft copolymer. One useful type of graft copolymer surfactant comprises a hydrophobic
10 polymer backbone having branches of a hydrophilic polymer along its length.

Copolymer surfactants in contrast agents according to the invention may, for example, contain hydrophilic regions or domains derived from polymers such as
15 polysaccharides, polyalcohols (e.g. polyvinyl alcohol), polyvinylpyrrolidone, polyethylene glycol and polyaminoacids. Polymers such as polyorthoesters, polyacetals, polyanhydrides, polyglycolic acids, poly(meth)acrylic acids and derivatives such as esters
20 thereof, substituted as necessary by hydrophilic groups, may also be useful. Contrast agents comprising copolymer surfactants in which the hydrophilic regions or domains consist essentially of polyethylene glycol units may be particularly advantageous.

25 The presence of charged groups within the hydrophilic regions or domains may be advantageous since their high water-solubility may permit use of relatively small hydrophilic regions or domains; interactions between such charged species may also enhance the
30 stability of dispersions of the copolymer surfactant by inhibiting aggregation.

Hydrophobic regions or domains in copolymer surfactants used in contrast agents according to the invention may, for example, be derived from oil-soluble
35 condensation, ionic and free-radical generated polymers, for example poly(meth)acrylate esters, polyorthoesters, vinylic and styrenic polymers, polyacetals,

- 9 -

polyanhydrides, polyglycolic acids and ethers and esters thereof, and polylactic acid/ polyglycolic acid copolymers; such polymers may, for example, incorporate or be substituted with hydrophobic groups such as alkyl, aralkyl or aryl groups to increase their hydrophobicity. The hydrophobic regions or domains may advantageously comprise a polyester chain (which may be an oligomeric or quasi-polymeric moiety) containing one or more long chain aliphatic groups (e.g. C₁₀₋₂₀ polymethylene groups).

10 The size of the hydrophobic blocks may particularly influence the wall-forming properties of copolymer surfactants which have low water-solubility, e.g. where these properties are (at least in part) the result of hydrophobic interactions. The physical state of the

15 hydrophobic block, e.g. whether it tends to form crystal or amorphous structures and the degree of hardness or softness thereof, may also be of importance.

 The different regions or domains of the copolymer surfactant may be joined directly or through a linker, e.g. comprising a polyvalent atom or inorganic group or a multifunctional organic group such as a monomer unit occurring in one of the regions or domains.

20

 As has previously been noted, polymer-based contrast agents should desirably be biodegradable in order to facilitate their ultimate elimination from or absorption by the test subject. The contrast agents of the invention are therefore preferably biodegradable, i.e. comprise copolymer surfactants which incorporate groups or bonds which are labile *in vivo*. The copolymer surfactants may therefore, for example, advantageously contain acid-labile bonds, e.g. as in polyorthoesters, polyacetals, polyanhydrides, polyglycolic acids and ethers, esters and polylactic acid copolymers thereof. Other potentially useful copolymer components exhibiting

25

30

35 biodegradability include polysaccharides, polyaminoacids, polylactides, lactide/ lactone copolymers, polypeptides, proteins, polydioxanones,

- 10 -

poly- β -aminoketones, polyphosphazenes, and poly(alkyl cyanoacrylates).

5 A particularly useful class of copolymer surfactants in contrast agents according to the invention contain enzymically biodegradable methylene diester groups, e.g. of formula (I) as defined above. Examples of such groups are described in the
10 aforementioned published International Patent Applications Nos. WO 92/04392 and WO 93/17718, the contents of which are incorporated herein by reference.

In such units of formula (I) R^1 and R^2 (when other than hydrogen) may, for example, each represent a carbon-attached hydrocarbyl or heterocyclic group, for example having 1-20 carbon atoms, e.g. an aliphatic
15 group such as an alkyl or alkenyl group (preferably having up to 10 carbon atoms), a cycloalkyl group (preferably having up to 10 carbon atoms), an araliphatic group such as an aralkyl group (preferably having up to 20 carbon atoms), an aryl group (preferably
20 having up to 20 carbon atoms) or a heterocyclic group having up to 20 carbon atoms and one or more heteroatoms selected from O, S and N. Such a hydrocarbyl or heterocyclic grouping may carry one or more functional groups such as halogen atoms or groups of the formulae
25 $-NR^3R^4$, $-CONR^3R^4$, $-OR^5$, $-SR^5$ and $-COOR^6$, where R^3 and R^4 are each hydrogen atoms, acyl groups or hydrocarbyl groups as defined for R^1 and R^2 ; R^5 is a hydrogen atom, an acyl group or a group as defined for R^1 or R^2 ; and R^6 is a hydrogen atom or a group as defined for R^1 or R^2 .
30 Where R^1 and R^2 represent a divalent grouping this may, for example, be an alkylidene, alkenylidene, alkylene or alkenylene group (preferably having up to 10 carbon atoms), which may carry one or more functional groups as defined above.

35 One preferred class of units of formula (I) comprises those in which R^1 and R^2 are each selected from hydrogen atoms and methyl groups, e.g. in which R^1

- 11 -

represents a hydrogen atom and R^2 represents a methyl group.

If desired the properties of the wall-forming polymer may be modified by a softener or elasticiser as
5 described in EP-A-0458745.

Any biocompatible gas may be employed in the contrast agents of the invention, for example air, nitrogen, oxygen, hydrogen, nitrous oxide, carbon dioxide, helium, argon, sulphur hexafluoride and low
10 molecular weight optionally fluorinated hydrocarbons such as methane, acetylene or carbon tetrafluoride. Use of perfluoroalkanes such as perfluorobutane or perfluoropentane may be advantageous. The gas may be free within the encapsulating structure formed by the
15 copolymer surfactant or may be entrained in a containing structure within the encapsulating structure. It will be appreciated that the term "gas" as used herein includes any substance which is in gaseous form at the normal human body temperature of 37°C.

20 The contrast agents of the invention may if desired incorporate one or more additional emulsifiers, for example selected from fatty acids (e.g. straight chain saturated or unsaturated fatty acids, for example containing 10-20 carbon atoms) and carbohydrate and
25 triglyceride esters thereof, phospholipids (e.g. lecithin), proteins (e.g. albumins such as human serum albumin), polyethylene glycols and block copolymers (e.g. poly(oxyethylene)-poly(oxypropylene)-poly(oxyethylene) block copolymers such as Pluronic),
30 including extended polymers. Block copolymer emulsifiers may, for example, have a similar gross composition to a block copolymer used as the wall-forming polymer surfactant, but may exhibit a different hydrophobic/lipophilic balance as a result of, for
35 example, different ratios between the contents of hydrophilic and hydrophobic blocks.

Microparticulate contrast agents of the invention

- 12 -

may if desired be coated, for example with one or more coating materials such as polyethylene glycols, proteins or polysaccharides, e.g. to modify their aggregation tendencies and/or biological properties.

5 Contrast agents according to the invention may be used in a variety of diagnostic imaging techniques, including ultrasound, MR and X-ray imaging. Their use in diagnostic ultrasonic imaging and in MR imaging, e.g. as susceptibility contrast agents, constitute preferred
10 features of the invention.

For ultrasonic applications such as echocardiography, in order to permit free passage through the pulmonary system and to achieve resonance with the preferred imaging frequency of about 0.1-15
15 MHz, it may be convenient to employ microbubbles having an average size of 0.1-10 μm , e.g. 1-7 μm . Substantially larger bubbles, e.g. with average sizes of up to 500 μm , may however be useful in other applications, for example gastrointestinal imaging or
20 investigations of the uterus or Fallopian tubes.

Microparticulate contrast agents according to the invention may, for example, be stored and transported in dry form, in which condition they will normally be stable indefinitely, being mixed with an appropriate
25 liquid carrier (e.g. sterile water for injection, physiological saline or phosphate buffer) prior to administration. In this way the concentration of the injected or otherwise administered contrast agent may be varied at will, depending on the precise nature of the
30 intended application. Contrast agents of the invention may also be stored in suspension in such carriers, especially when the porosity of the encapsulating polymer membrane is comparatively low, and/or the encapsulated gas has low solubility in the carrier
35 liquid.

The contrast agents of the invention may be prepared by any convenient process. Such processes,

- 13 -

which in general will involve interacting a gas with a non-polymerisable wall-forming block or graft surfactant so as to produce the desired contrast agent, constitute a further feature of the invention.

5 Representative microencapsulation techniques for the preparation of materials encapsulated by a wall or membrane of polymer material are described in literature such as "Microencapsulation and Related Drug Processes" by P.D. Deasy, Marcel Dekker Inc., New York (1984).

10 Contrast agents according to the invention may conveniently be prepared by emulsion techniques, e.g. such as are known in the polymer art. Such processes may typically involve (i) generating an emulsion comprising hydrophilic and hydrophobic phases wherein
15 the copolymer surfactant is preferentially solubilised in the dispersed phase thereof or is distributed about the interfaces between said phases and (ii) obtaining the desired contrast agent from the emulsion. Single or
20 multiple emulsions may be generated; in the latter case the copolymer surfactant will desirably be
25 preferentially solubilised in or distributed about the interfaces of the finest (i.e. innermost) of the dispersed phases. Representative multiple emulsion techniques are described in WO 93/17718.

30 The hydrophilic/lipophilic balance of copolymer surfactant starting materials may be selected to give copolymers appropriate to a particular form of emulsion processing. Thus, for example, the processing of oil-soluble copolymer surfactants using oil-in-water
35 emulsions may be advantageous. It may also be possible to use an oil-in-water emulsion to process a copolymer surfactant having a degree of water-solubility where the water-soluble blocks are such as to create strong attractive interactions which slow the kinetics of
dissolution sufficiently to permit microparticle
formation in the presence of water; a similar approach may be taken using a water-in-oil emulsion and a

- 14 -

copolymer surfactant having a degree of oil-solubility.

Where it is desired to use copolymer surfactants which become distributed at the phase interfaces, e.g. in the form of a film or separate phase, it may be
5 useful to employ copolymer surfactants capable of aggregation into liquid crystalline structures, e.g. as lamellar phases, hexagonal or reversed hexagonal phases, cubic phases, or other liquid or solid phases of copolymer surfactants in admixture with other
10 components.

The hydrophobic phase of emulsions generated in accordance with this aspect of the process of the invention may, for example, comprise a water-immiscible organic solvent such as an aliphatic, cycloaliphatic or
15 araliphatic hydrocarbon, e.g. containing up to 10 carbon atoms, for example n-octane, cyclooctane, a dimethylcyclohexane, ethylcyclohexane, a methylheptane, an ethylhexane, toluene, xylene or a terpene, terpenoid or isoprenoid such as camphene or limonene; a
20 haloalkane, such as methylene chloride, chloroform, carbon tetrachloride, methyl bromide or a Freon; an ester such as ethyl or propyl acetate, butyl formate or propyl or isopropyl butyrate or isobutyrate; or an appropriate ether or other lipophilic solvent.

25 The emulsion may, for example, be prepared using conventional techniques such as agitation, sonication, stirring (preferably high speed stirring) or other forms of mixing (e.g. high shear mixing), the copolymer surfactant advantageously being predissolved in what is
30 to be the dispersed phase. It will be appreciated that factors such as stirring speed will influence the size of the encapsulated microbubbles ultimately produced; thus, for example, faster stirring tends to yield smaller microbubbles.

35 One useful embodiment of this process according to the invention comprises generating a single or multiple emulsion wherein the copolymer surfactant is

- 15 -

preferentially distributed about the (where appropriate innermost) interfaces between the phases, and removing either the dispersed phase or both phases, e.g. by evaporation, spray drying or, more preferably, lyophilisation, to generate a desired microparticulate contrast agent. The emulsion, which may for example be an oil-in-water, water-in-oil or water-in-oil-in-water emulsion, may advantageously be lyophilised or otherwise treated under an atmosphere of the gas which is to be incorporated in the contrast agent, if desired at reduced pressure. Emulsifiers such as fatty acids and esters, phospholipids, proteins, polyethylene glycols and block copolymers (e.g. as hereinbefore described) may if desired be used in the emulsification process.

Where only the dispersed phase is removed in such a process the microparticles may be recovered from the dispersion phase by, for example, flotation or filtration.

In an alternative process a solution of the copolymer surfactant in an appropriate aprotic polar organic solvent (e.g. a sulfoxide such as dimethyl sulfoxide, a cyclic ether such as tetrahydrofuran or an N,N-disubstituted amide such as dimethylformamide) is mixed with an aqueous phase (e.g. using a high speed stirrer) so as to precipitate polymer material which may be collected and lyophilised to yield microparticulate contrast agents in accordance with the invention. The aqueous phase may advantageously contain a polymer material such as polyvinyl alcohol or poloxamer (e.g. a Pluronic). Such techniques are described in the above-mentioned EP-A-0458079.

A further process comprises injecting a solution of the copolymer surfactant in an appropriate organic solvent into liquid nitrogen; the solution may, if desired, also contain an additive such as hydroxypropylcellulose. Alternatively the copolymer surfactant may be dissolved in an appropriate solvent or

- 16 -

dispersed in e.g. an oil-in-water, water-in-oil or multiple emulsion, and the solution or emulsion spray dried, e.g. as described in EP-A-0514790.

5 Coacervation techniques, e.g. as are known in the art, may also be employed in preparing contrast agents according to the invention.

Contrast agents of the invention may also be prepared by selecting copolymer surfactants having good film-forming properties as a result of their
10 hydrophilic/lipophilic balances and molecular sizes and which therefore have the ability to self-organise into micellar or liposome-like structures. Such copolymer surfactants may be used to prepare solutions or dispersions of amphiphiles in laminar or lamellar form
15 which may be used to generate gas-containing vesicles as described in WO 91/15244. Mixtures of copolymer surfactants with phospholipids (as well as synthetic biodegradable phospholipid derivatives of the copolymer surfactants, e.g. prepared as described by Laschewsky et
20 al. in J. Am. Chem. Soc. 109 (1987), P. 788), optionally incorporating solubilising or viscosity-increasing agents such as glycerol, propylene glycol, glucose or lactose, may also be used for the preparation of echogenic vesicles, e.g. as described in EP-A-0554213.

25 In a still further variant of the process of the invention a gas-in-liquid emulsion is prepared in which the dispersed phase comprises the gas to be encapsulated and in which the copolymer surfactant is preferentially soluble in the liquid continuous phase, thereby
30 generating a contrast agent comprising a dispersion of gas microbubbles stabilised by encapsulating copolymer surfactant. In a preferred embodiment of this process the gaseous dispersed phase is a hydrophobic perfluoroalkane such as perfluorobutane or perfluoropentane and the dispersion phase is an aqueous solution
35 of a water-soluble copolymer surfactant, e.g. an extended polymer.

- 17 -

Copolymer surfactants useful in the preparation of contrast agents according to the invention may, for example, be prepared by methods known in the art, e.g. as described in Polymer Surfactants by Irja Piirma (Surfactant Science Series Vol. 42 - Marcel Dekker, New York, 1992), the contents of which are incorporated herein by reference. Thus, for example, block copolymers may be prepared by techniques such as the active end group approach, anionic polymerisation, cationic polymerisation or condensation of prepolymers. Graft copolymers may, for example, be prepared by copolymerising a macromonomer comprising a polymer terminating at one end in a polymerisable group with a second monomer or by "grafting onto" or "grafting from" methods. Suitable block and block-graft copolymers are described in "Block Copolymers" by D.C. Allport & W.H. Janes, (Applied Sciences Publishers Ltd., London 1973).

The hydrophilic/lipophilic balance of the copolymer surfactants will be determined by factors such as the nature of the polymers constituting the different blocks and the relative ratio between the total volumes of e.g. hydrophilic and hydrophobic blocks. This balance may therefore be selected to give polymers appropriate to a particular form of emulsion processing, e.g. as described above.

Block and graft copolymer surfactants containing biodegradable linkages of formula (I) as hereinbefore defined are themselves novel and constitute a further feature of the present invention, as do emulsions comprising such copolymer surfactants, e.g. emulsions comprising phases of differing lyophilicity wherein the copolymer surfactant is preferentially solubilised in the dispersed phase thereof or is distributed about the interfaces between said phases. Most commonly the phases will be hydrophilic and hydrophobic respectively, although the copolymer surfactants may also be used to stabilise oil-in-oil emulsions of immiscible oils.

The novel copolymer surfactants according to the

- 18 -

invention may, for example, contain representative or preferred atoms/groups R^1 and R^2 and hydrophilic and hydrophobic regions or domains as hereinbefore described. The biodegradable linkages may for example
5 comprise units of formula

(where R^1 , R^2 , m and n are as hereinbefore defined and a
10 and b are each integers in the range 1-30, preferably 10-18).

Preferred copolymer surfactants in accordance with this embodiment of the invention are block copolymers, including extended polymers. In addition to their
15 usefulness as starting materials for the preparation of contrast agents according to the invention these novel block copolymer surfactants containing biodegradable linkages of formula (I) may have a wide range of further utilities, e.g. by analogy with known block copolymer
20 surfactants (see for example Encyclopedia of Polymer Science Vol. 2 pp. 412-434 - John Wiley and Sons, New York (1985)).

Block copolymer surfactants in accordance with the invention may therefore find use in applications such as
25 foods, e.g. in water-in-oil emulsions such as mayonnaise and margarine and oil-in-water emulsions such as synthetic milk and ice cream; paints, coatings and impregnations, e.g. as dispersing agents for pigments or as biodegradable coatings to impart properties such as
30 water-resistance or a glossy finish to materials such as paper or cardboard; cosmetics, e.g. moisturising cream and make-up; detergents, e.g. for general washing and cleaning as in laundry applications, or for dispersal of oil spills; phase transfer catalysts; drug formulations,
35 e.g. as dispersants, solubilisers, gelling agents and emulsifying agents for drugs (including water-insoluble drugs); drug delivery systems, e.g. as carriers

- 19 -

(including micellar carriers) to promote site-specific delivery and/or delayed release of drugs, where appropriate with concomitant reduction in toxic side effects; surgical materials such as implants, wound dressings, adhesives and the like, e.g. controlled release implants, implants for fracture fixation, tendon and ligament replacements, biodegradable dressings, dressings with controlled release, sutures, controlled release creams and ointments, adhesives and bone cements; particle coatings, e.g. to provide targetting of an active therapeutic agent to a desired site such as the lymphatic system; coating of medical devices, e.g. to promote protein resistance; textiles, e.g. as antistatic agents; thermoplastic elastomers (in contrast to conventional non-melt processable crosslinked elastomers) which may be used to manufacture slowly biodegradable replacement body parts such as blood vessels by thermal processing; biodegradable clear packaging films, wherein the domain sizes for the polymer blocks are less than the wavelength of visible light; polymer property modifiers, e.g. as dispersed particles in another polymer matrix, for example to modify the fracture properties thereof; self-lubricating materials, e.g. wherein biodegradation generates low molecular weight compounds which provide a lubricating effect; compatibilisers for polymer blends, e.g. to facilitate dispersion of one polymer in another (the biodegradability of the copolymer surfactant may be utilised to accelerate degradation of an otherwise relatively stable polymer blend); separation membranes exhibiting selective transport properties, e.g. as wound coatings permitting transport of gas to the wound but providing a barrier to dirt and infection; anti-fouling coatings, e.g. such that continuous controlled biodegradation from the surface prevents adhesion of organisms, secondary toxic components optionally being incorporated to provide further protection through

- 20 -

controlled release thereof; foam-forming materials, e.g. for dispersing blowing agents or producing biodegradable foams useful for introducing cells in, for example, bone marrow, pancreas, liver and cartilage transplants;
5 antifoams, e.g. for use in machine dishwashing and the sugar beet industry; and in the manufacture of hydrogels, e.g. for use in the controlled release of drugs or agrochemicals, in cosmetics and toiletries, and as highly absorbent materials, e.g. for nappies or spill
10 containment.

The following non-limitative Examples serve to illustrate the invention.

EXAMPLE 1 - Preparation of intermediates and pre-polymers

a) Methylene bis(16-hydroxyhexadecanoate)

5

To a solution of 16-hydroxyhexadecanoic acid (15.0g, 0.055 mol) in DMF (200 ml), DBU (8.65g, 0.055 mol) was added at room temperature. After 5 minutes with stirring, diiodomethane (7.37g, 0.028 mol) was added.

10 The mixture was left with stirring at room temperature for 2 days. DMF was evaporated under reduced pressure and the residue dissolved by adding chloroform (100 ml) and water (50 ml). After separating the phases the aqueous layer was extracted with chloroform (3 x 100 ml) and the combined organic phases were dried (MgSO₄). The solvent was removed under reduced pressure and the residue recrystallised from ethyl acetate to give 10.17g (65%) of the title product as a white solid. Mp: 96.2°C. ¹HNMR (300 MHz, CDCl₃): δ 1.2-1.4 (m, 44H), 1.5-1.6 (m, 8H), 2.35 (t, 4H), 3.64 (t, 4H), 5.75 (s, 2H). ¹³CNMR (75MHz, CDCl₃): δ 24.43, 25.55, 28.81, 29.42, 32.63, 33.80, 62.91, 78, 172.20.

b) Acid chloride terminated poly(methyl methacrylate)
1000

25

Acid terminated poly(methyl methacrylate) was synthesised by a matched chain transfer polymerisation. 2-Ethoxyethanol (160g) was heated to 120°C. To this a mixture of 2-ethoxyethanol (80g), methyl methacrylate (160g, 1.6 mol), thioglycollic acid (14.4g, 0.156 mol) and 4,4'-azobis(4-cyanopentanoic acid) (14.4g, 0.1 mol) was added over a period of 1.5 hours. The reaction was held at 120°C for a further 0.5 hours before cooling to room temperature. The polymer was precipitated into a cold solution of sodium chloride (5% w/v). The polymer was purified by repeated precipitation from hot methanol

30

35

- 22 -

into cold distilled water (3 times). End group analysis gave a number average molecular weight of 910 Daltons.

5 Acid terminated poly(methyl methacrylate) (105g, 0.115 mol) was dissolved in dry toluene (300 ml). The solution was cooled to 0°C and oxalyl chloride (15g, 0.118 mol) was added slowly. The reaction was permitted to warm to room temperature, whereafter the excess oxalyl chloride was removed under reduced pressure to
10 yield the title product

c) α -Methyacryloyl- ω -methoxy (PEG) 2000

15 Dry α -Hydroxy- ω -methoxy PEG 2000 (6.40g, 3.20 mmol) was dissolved in THF (160 ml) and the solution cooled to 10°C. Pyridine (0.38g, 4.78 mmol) was diluted with THF (4 ml) and added to the solution under a dry nitrogen atmosphere. Methacryloyl chloride (0.50g, 4.78 mmol) was diluted in THF (12 ml) and added dropwise. The
20 temperature was gradually raised to room temperature and the mixture was left with stirring for 24 hours. The reaction mixture was filtered and the remaining acid chloride and solvent removed under reduced pressure. The residue was dissolved in THF and precipitated by
25 addition of ether to give 4.50g (68%) of the title product.

d) Bimetallic μ -Oxoalkoxide Catalyst:

30 Following the method of US-A-3432445, anhydrous zinc acetate (23.00g, 125.4 mmol) was added to a solution of aluminium isopropoxide (51.20g, 250.7 mmol) in decahydronaphthalene (130 ml). The mixture was heated
35 to 190°C with stirring under nitrogen and the reaction allowed to proceed for three hours during which about 20 ml distillate was collected in the boiling range 73-88°C.

- 23 -

The decahydronaphthalene was then removed under reduced pressure at 160-180°C. The product, a resinous orange solid, was dissolved in distilled n-heptane and the solution centrifuged to remove any remaining solids. A typical preparation gave low yield (23%) and analysis for Al and Zn content gave a mole ratio of Al/Zn of 1.98.

5 e) Ethylidene bis[16-(5-chlorocarbonylpentanoyloxy)-
10 hexadecanoate]

In a three-necked round bottomed flask equipped with a reflux condenser, a glass gas inlet tube and a pressure equalizing dropping funnel was placed freshly distilled adipoyl chloride (2.60 ml, 17.50 mmol) dissolved in absolute chloroform (15 ml). The temperature was raised to ca. 50°C and under a gentle stream of nitrogen through the solution, a solution of ethylidene bis(16-hydroxy-hexadecanoate) (1.0g, 1.75 mmol) in absolute chloroform (30 ml) was added dropwise and left at this temperature a further 3 hours after addition. The mixture was then cooled to room temperature and quickly transferred into a 50 ml round bottomed flask equipped for distillation under reduced pressure. Chloroform was first distilled off at normal pressure, then oil-pump vacuum was established and excess adipoyl chloride distilled off at ca. 75°C, 5 mbar pressure, leaving the residual title compound (1.56g).

30 f) 16-Hexadecanoyloxyhexadecanoic acid

16-Hydroxyhexadecanoic acid (5.43g, 19.9 mmol) was dissolved in tetrahydrofuran (190 ml) and pyridine (2.36g, 29.9 mmol) was added. Palmitoyl chloride (5.48g, 19.9 mmol) was dissolved in tetrahydrofuran (10 ml) and added dropwise at room temperature. After stirring at room temperature for 16 hours, the mixture

- 24 -

was filtered and the filtrate evaporated under reduced pressure. The residue was dissolved in chloroform, washed with water (3 x 50 ml), and the organic phase was dried (MgSO₄). After evaporating under reduced pressure, the residue was purified on a silica column, eluted with chloroform with increasing methanol concentration (from 1% to 2% methanol in chloroform) to give 8.41g (83%) of the title compound. ¹H NMR (300 MHz, CDCl₃): δ 0.85 (t, 3H, CH₃), 1.20-1.35 (s, 46H, -CH₂-), 1.55-1.70 (m, 6H, -CH₂-), 2.25 (t, 2H, -CH₂-C(O)-O), 2.45 (t, 2H, -CH₂-COOH), 4.05 (t, 2H, -O-CH₂). ¹³C NMR (75 MHz, CDCl₃): δ 14.01, 22.57, 24.10, 24.91, 25.82, 28.53, 28.75, 28.94, 29.08, 29.15, 29.25, 29.36, 29.54, 31.81, 34.29, 35.16, 64.27, 76.48, 76.90, 77.10, 77.32, 169.50, 173.91.

g) 16-Hexadecanoyloxyhexadecanoyl chloride

16-Hexadecanoyloxyhexadecanoic acid (7.73g, 15.13 mmol) prepared as in (f) above was dissolved in tetrahydrofuran (140 ml) and oxalyl chloride (4.80g, 37.83 mmol) was added dropwise. The mixture was stirred at room temperature for 3 days and then the solvent and unreacted oxalyl chloride were evaporated under reduced pressure to give 8.0g (100%) of the title compound.

h) 1-[16-(16-Hexadecanoyloxyhexadecanoyloxy)-hexadecanoyloxy]ethyl 16-hydroxyhexadecanoate

Ethylidene bis (16-hydroxyhexadecanoate) (4.38g, 7.67 mmol) was dissolved in THF (80 ml) and pyridine (0.61g, 7.71 mmol) was added. 16-hexadecanoyloxyhexadecanoyl chloride (4.18g, 7.90 mmol) was dissolved in THF (20 ml) and added dropwise. After 3 days at room temperature the mixture was filtered and the filtrate was left at -20°C for 2 hours. The precipitated product was filtered and purified by flash chromatography (silicagel, chloroform) to give 2.4g (29%) of the title compound. ¹H

- 25 -

NMR (300 MHz, CDCl_3): δ 0.85 (t, 3H, CH_3), 1.2-1.4 (s, 90H, $-\text{CH}_2-$), 1.45 (d, 3H, $-\text{O}-\text{CH}(\text{CH}_3)-\text{O}-$), 1.5-1.7 (m, 14H, $-\text{CH}_2-$), 2.25 (m, 8H, $-\text{CH}_2-\text{C}(\text{O})-\text{O}-$), 3.60 (t, 2H, $-\text{CH}_2-\text{OH}$), 4.05 (t, 4H, $-\text{C}(\text{O})-\text{O}-\text{CH}_2-$), 6.85 (q, 1H, $-\text{O}-\text{CH}(\text{CH}_3)-\text{O}-$). ^{13}C NMR (75 MHz, CDCl_3): δ 13.7, 19.1, 22.2, 24.2, 24.6, 25.2, 25.5, 28.2, 28.5, 28.7, 28.8, 29.0, 29.2, 31.5, 32.3, 33.7, 34.0, 62.5, 64.0, 88.0, 171.5, 173.5.

10 i) Preparation of Methoxy-endcapped PEGs

Preparation of a Typical Polymer (MeO-PEG 2000)

An initiator solution was prepared by careful addition of potassium metal (0.400 g, 10.23 mmol) to methanol (1.300g, 40.57 mmol) in an inert atmosphere. This initiator solution (0.220g, 1.32 mmol potassium methoxide) was injected into an ampoule containing ethylene oxide (10.000g, 227.00 mmol). The sealed ampoule was allowed to stand at room temperature overnight. The temperature was then raised to 60°C and reaction allowed for 72 hours. After removal of unreacted monomer, the contents of the ampoule were dissolved in dichloromethane and the solution neutralised with dilute aqueous hydrochloric acid. The polymer solution was washed three times with distilled water, rotary evaporated and then vacuum dried.

Assignments for MeO-PEG polymers. ^1H -NMR: δ 2.7 (OH), 3.2 (OCH_3), 3.5 ($-\text{CH}_2-$ main chain), 3.4 ($-\text{CH}_2\text{OCH}_3$). ^{13}C -NMR: δ 58.5 ($-\text{OCH}_3$), 61.2 ($-\text{CH}_2\text{OH}$), 70.5 ($-\text{CH}_2-$ main chain), 71.3 ($-\text{CH}_2\text{OCH}_3$), 72.2 ($-\text{CH}_2\text{CH}_2\text{OH}$). The GPC was recorded in THF and the molecular weight calibration was via PEG standards. GPC data for a typical sample: Mp: 2679, Mn: 2012, Mw: 2283. Polydispersity: 1.135.

35 j) General procedure for methoxy PEG chloroformate

PEG 2000 monomethyl ether (6.00g, 3.00 mmol) was

- 26 -

dissolved in toluene (50 ml) and dried by refluxing in a Dean Stark apparatus. Pyridine (0.24g, 3.00 mmol) was added at room temperature. Trichloromethyl chloroformate ("diphosgene") (0.60g, 3.00 mmol) was dissolved in toluene (10 ml) and added dropwise. The mixture was stirred at room temperature for 12 hours and filtered. The solvent was evaporated under reduced pressure to give the title compound in quantitative yield.

10

EXAMPLE 2 - Preparation of Block and Graft copolymers

- 15 a) PEG 5000-block-Polyester of Methylene bis(16-hydroxyhexadecanoate & adipoyl chloride-block-PEG 5000

Methylene bis(16-hydroxyhexadecanoate) (0.56g, 1.0 mmol) and dry α -methoxy- ω -hydroxy PEG of number average molecular weight 5000 (0.5g, 0.1 mmol) were dissolved in a mixture of xylene/trichloroethylene (80:20 100 ml), and heated to 60°C. Adipoyl chloride (0.192g, 1.05 mmol) was added. The mixture was refluxed at reduced pressure and 60°C for 24 hours. The polymer was recovered by fractional precipitation from xylene/trichloroethylene (80:20) at 4°C. The product was shown by SEC to have a Mn of 3800 and a Mw of 8000 (polystyrene equivalents).

- 30 b) PEG 2000-block-Polyester of methylene bis(16-hydroxyhexadecanoate) & adipoyl chloride-block-PEG 2000 (Method 1)

35 Methylene bis(16-hydroxyhexadecanoate) (0.56g, 1.0 mmol) and dry α -methoxy- ω -hydroxy PEG of number average molecular weight 2000 (0.0572g, 0.0286 mmol) were dissolved in a mixture of xylene/trichloro-ethylene

- 27 -

(80:20 - 100 ml), and heated to 60°C. Adipoyl chloride (0.186, 1.014 mmol) was added. The mixture was refluxed at reduced pressure and 60°C for 24 hours. The polymer was recovered by fractional precipitation from
5 xylene/trichloroethylene (80:20) at 4°C. The product was shown by SEC to have a Mn of 3400 and a Mw of 12700 (polystyrene equivalents).

c) PEG 2000-block-Polyester of methylene bis(16-
10 hydroxyhexadecanoate & adipoyl chloride-block-PEG
2000 (Method 2)

Methylene bis(16-hydroxyhexadecanoate) (0.56g, 1.0 mmol) was dissolved in a mixture of xylene/trichloroethylene
15 (80:20 - 100 ml), and heated to 60°C. Adipoyl chloride (0.201, 1.1 mmol) was added. The mixture was refluxed at reduced pressure and 60°C for 35 minutes. Dry α -methoxy- ω -hydroxy PEG of number average molecular weight 2000 (0.4g, 0.2 mmol) was added to the reaction mixture.
20 The mixture was refluxed at reduced pressure and 60°C for a further 24 hours. The polymer was recovered by fractional precipitation from xylene/trichloroethylene (80:20) at 4°C. The product was shown by SEC to have a Mn of 5200 and a Mw of 17500 (polystyrene equivalents).
25

d) Di-block copolymer of Poly(methyl methacrylate)
1000 and PEG 2000

α -Hydroxy- ω -methoxy PEG of number average molecular
30 weight 2000 (40g, 0.02 mol) was dissolved in toluene and dried with molecular sieve (4Å). To this a solution of acid chloride terminated poly(methyl methacrylate) as produced in Example 1(b) (20g, 0.02 mol) in toluene was added. The mixture was refluxed for 24 hours. The
35 polymer was isolated by precipitation with petroleum ether (40-60). The polymer was purified by ion exchange (IRA-400, Fisons) and by dissolution in water, heating

- 28 -

above the cloud point of the copolymer and decantation (three times). The product so obtained was finally dissolved in toluene and precipitated with petroleum ether (40-60) to yield the title product as a white powder.

e) Di-block copolymer of Poly(methyl methacrylate) 1000 and PEG 4000

10 α -Hydroxy- ω -methoxy PEG of number average molecular weight 4000 (80g, 0.02 mol) was dissolved in toluene and dried with molecular sieve (4Å). To this a solution of acid chloride terminated poly(methyl methacrylate) as produced in Example 1(b) (20g, 0.02 mol) in toluene was
15 added. The mixture was refluxed for 24 hours. The polymer was isolated by precipitation with petroleum ether (40-60). The polymer was purified by ion exchange (IRA-400, Fisons) and by dissolution in water, heating above the cloud point of the copolymer and decantation
20 (three times). The product so obtained was finally dissolved in toluene and precipitated with petroleum ether (40-60) to yield the title product as a white powder.

25 f) Poly(Methyl methacrylate)-graft-PEG 2000

α -Methacryloyl- ω -methoxy PEG of number average molecular weight 2000 as synthesised in Example 1(c) (0.50g, 0.25 mmol) and AIBN (2mg, 0.012 mmol) were
30 dissolved in THF (3.0 ml) and degassed by repeated freezing, evacuation and thawing cycles (4 times). Methyl methacrylate (0.5 ml, 4.7 mmol) was distilled directly into the ampoule and the ampoule sealed. Polymerisation was performed in an oil bath at 60°C for
35 22.75 hours.

The polymer was recovered by precipitation with

- 29 -

petroleum ether (40-60) then purified by dissolving in a small amount of THF and adding to water (200 ml). On heating above 60°C the polymer came out of solution. The title product was dried under reduced pressure.

5

g) Multi-block copolymer of PEG and poly(methylene-bis(16-hydroxyhexadecanoate) plus adipoyl chloride (1:3:4)

10

1) Polyester formation

Methylene bis(16-hydroxyhexadecanoate) (1.392g, 2.50 mmol) was dissolved in a xylene/trichloroethylene mixture (80:20), and heated to 60°C. Adipoyl chloride (0.610g, 3.33 mmol) was added. The mixture was refluxed at reduced pressure and 60°C for 4 hours.

15

2) Coupling of blocks to give multi block copolymer

Dry α,ω di-hydroxy PEG 1500 (1.25g, 0.833 mmol) was added to the reaction mixture from above. Refluxing at reduced pressure was continued for 2 days. The polymer was recovered by drying at reduced pressure. The residue was dissolved in dichloromethane and precipitated from methanol. SEC showed the product to have a Mn of 5600 and a Mw of 9400 (polystyrene equivalents) and that there was no evidence of the presence of PEG homopolymer. ¹HNMR indicated formation of a block copolymer with a molar composition of 2.6:1 polyester to poly(ethylene oxide).

20

25

30

h) Di-block copolymer of PEG 2000 and Poly(lactic acid) 2000

α -Hydroxy- ω -methoxy PEG 2000 (10.0g, 5.0 mmol) was dissolved in toluene (300 ml) and dried by refluxing in a Dean and Stark trap for 12 hours. Poly(lactic acid) (Resomer L-104, Molecular weight 2000) (1.0g, 0.5 mmol) and p-toluenesulfonic acid mono hydrate (2 mg, 0.001

35

- 30 -

mmol) were added. After Dean and Stark refluxing of the mixture for three days, the solvent was removed under reduced pressure, and the residue was washed with water and filtered.

5

i) Block copolymer of methylene bis(16-hydroxyhexadecanoate), adipoyl chloride and α -hydroxy- ω -methoxy PEG 2000

10 Methylene bis(16-hydroxyhexadecanoate) (8.0g, 14.37 mmol) was dissolved in xylene/trichlorethylene (4:1) (250 ml) and heated to 60°C. Adipoyl chloride (freshly distilled) (2.92g, 15.97 mmol) was added dropwise and the mixture refluxed at 60°C under vacuum (100 mbar) for
15 5 hours. Dry α -hydroxy- ω -methoxy PEG 2000 (6.39g, 3.19 mmol) dissolved in toluene (58 ml) was added together with trichloroethylene (14 ml). The mixture was refluxed under vacuum (100 mbar) for another 14 hours. After cooling to room temperature and precipitating in a
20 refrigerator, the mixture was filtered. The precipitate was dissolved in chloroform and precipitated once from hexane and then twice from methanol. A portion of the crude product (4.25g) was dissolved in chloroform and precipitated once more from methanol to give the title
25 compound (3.78g): ^1H NMR 200 MHz δ : 1.3 (s, CH_2), 1.5-1.7 (m, CH_2), 2.2-2.4 (m, CH_2CO), 3.6 (s, $\text{OCH}_2\text{CH}_2\text{O}$), 4.0-4.1 (m, CH_2O), 5.7 (s, OCH_2O). SEC: $M_p=21,191$; $M_n=5,571$; $M_w=21,079$ (polystyrene equivalents).

30 j) Block copolymer of methylene bis(16-hydroxyhexadecanoate), adipoyl chloride and α -hydroxy- ω -methoxy PEG 2000

Methylene bis(16-hydroxyhexadecanoate) (7.50g, 13.47
35 mmol) was dissolved in xylene/trichlorethylene (4:1) (235 ml) and heated to 70°C. Adipoyl chloride (freshly distilled) (2.74g, 14.97 mmol) was added dropwise and

- 31 -

the mixture refluxed at 70°C under vacuum (100 mbar) for 5 hours. Dry α -hydroxy- ω -methoxy PEG 2000 (5.99g, 2.99 mmol) dissolved in toluene (53 ml) was added together with trichloroethylene (13 ml). The mixture was
5 refluxed under vacuum (100 mbar) for another 40 hours. After cooling to room temperature and precipitating in a refrigerator, the mixture was filtered. The precipitate was dissolved in chloroform and precipitated once from hexane and then once from methanol. Half the crude
10 product was purified by flash chromatography (silica, eluant: chloroform with stepwise increasing methanol concentration from 0 to 5%) giving the title compound (1.50g). ^1H NMR 300 MHz δ : 1.23 (s (br), CH_2), 1.57-1.65 (m, CH_2), 2.31-2.36 (m, CH_2CO), 3.37 (s, CH_3O), 3.63 (s, $\text{OCH}_2\text{CH}_2\text{O}$), 4.01-4.06 (m, CH_2O), 5.73 (s, OCH_2O). SEC:
15 $M_p=13,313$; $M_n=6,357$; $M_w=12,351$, (polystyrene equivalents).

k) Block copolymer of ethylidene bis(16-hydroxyhexadecanoate), adipoyl chloride and α -hydroxy- ω -methoxy PEG 2000

20

Ethylidene bis(16-hydroxyhexadecanoate) (2.00g, 3.50 mmol) was dissolved in xylene/trichloroethylene (4:1) (70 ml) and heated to 70°C. Adipoyl chloride (freshly
25 distilled) (0.73g, 3.99 mmol) was added dropwise and the mixture refluxed at 70°C under vacuum (100 mbar) for 6 hours. Dry α -hydroxy- ω -methoxy PEG 2000 (1.72g, 0.86 mmol) dissolved in toluene (15 ml) was added together
30 with trichloroethylene (3 ml). The mixture was refluxed under vacuum (100 mbar) for another 40 hours. After cooling to room temperature and precipitating in a refrigerator, the mixture was filtered. The precipitate was dissolved in chloroform and purified by flash
35 chromatography (silica, eluant: chloroform with 0.75% methanol) to give the title compound (0.42g). ^1H NMR 300 MHz δ : 1.24 (s (br), CH_2), 1.44 (d, $\text{CH}_3\text{-CH}$), 1.59-1.64

5 1-r) Preparation of Di-block Copolymers:
 General Procedure

- 10 The di-block copolymers were prepared by sequential polymerization of ethylene oxide (EO) with caprolactone (CPL), of ethylene oxide with lactide (LD), and of ethylene oxide with caprolactone and lactide. The polymerisations were catalyzed by the bimetallic μ -oxoalkoxide as prepared in Example 1(d).
- 15 The dry solvent, toluene or tetrahydrofuran, was distilled into a flamed glass ampoule. Ethylene oxide was dried over calcium hydride and condensed into the glass ampoule under high vacuum. An appropriate quantity of catalyst, to give an ethylene oxide block of
- 20 the desired length, was added by injection into the ampoule under a nitrogen atmosphere. The ampoule was sealed, heated to 60°C and the reaction allowed to proceed for 24 hours. Caprolactone, lactide, or caprolactone and lactide mixtures in tetrahydrofuran
- 25 were next added by injection of an appropriate quantity into the ampoule under a nitrogen atmosphere. The ampoule was heated to 60°C for 24 hours, and then the polymerization was terminated by addition of isopropyl amine. The polymer solution was diluted with
- 30 tetrahydrofuran and washed with dilute aqueous citric acid to remove catalyst residues. The polymer solution was further washed with distilled water until neutral and the high molecular weight polymer precipitated with n-heptane. The precipitated polymer was finally vacuum
- 35 dried to yield a white polymer. The nature of the polymerizations performed and results are summarized in Table 1.

- 33 -

s) Polymerization catalyzed by aluminium isopropoxide

Aluminium isopropoxide (1.19g, 5.8 mmol) was dried under high vacuum in a glass ampoule for 4 hours at room temperature. Dry toluene was distilled into the ampoule under high vacuum and dissolution of the aluminium isopropoxide allowed. Ethylene oxide (7.42g, 168.6 mmol) was dried over calcium hydride and condensed into the glass ampoule under high vacuum. The ampoule was sealed, heated to 45°C and reaction allowed to proceed for 39 hours. Caprolactone (8.63g, 75.6 mmol) was next added by injection into the ampoule under a nitrogen atmosphere. The ampoule was heated to 45°C for a further 24 hours. The highly viscous product was dissolved in dichloromethane, the polymerization terminated with dilute aqueous acetic acid and the high molecular weight polymer precipitated with n-heptane. Molecular weight was determined by ¹H-NMR indicating ethylene oxide and caprolactone block lengths at 500 and 5,200,

- 34 -

respectively.

t-y) Preparation of Poly(Methyl Methacrylate) - graft-
PEGs: General procedure

5

α-Methacryloyl-ω-methoxy PEG 2,000 as synthesised in Example 1(c) was added to AIBN in a glass reactor and then evacuated. Toluene (ca. 40ml) was distilled under vacuum into the reactor followed by destabilised methyl methacrylate (MMA) monomer. The reactor was sealed and then heated to 50°C for approximately 20 hours. The title polymer was recovered by precipitation into heptane. It was purified by dissolving in a minimum amount of THF, adding this solution to water and then heating above the cloud point of the polymer, at which point the polymer came out of solution. This was repeated once. The prepared graft copolymers were characterised by ¹H-NMR (Table 2):

20

z) Random chain-extended polymer of PEG 1500, adipoyl chloride and ethylidene bis(16-hydroxyhexadecanoate) (0.37:1.85:1.75), multiblock

5 To a suspension of ethylidene bis(16-hydroxyhexadecanoate) (1.0g, 1.75 mmol) in dimethoxyethane (10 ml) at room temperature was added freshly distilled adipoyl chloride (270 μ l, 1.85 mmol). The temperature of the mixture was gradually raised to 60°C, and a colourless
10 solution obtained. After 5 hours at this temperature PEG 1500 (0.55g, 0.37 mmol) was added and heating continued for a further 17 hours before the mixture was cooled to room temperature, the solvent evaporated and the solid residue stirred in petroleum ether (bp 40-60°C)
15 for 15 minutes and filtered to give the title compound (1.30g) as a white solid.

aa) Extended polymer from PEG 1500 and ethylidene bis[16-(5-chlorocarbonylpentanoyloxy)-hexadecanoate] (A-B-A)

20

Ethylidene bis[16-(5-chlorocarbonylpentanoyloxy)-hexadecanoate] prepared as in Example 1(e) (0.88 g, 1.02 mmol) was dissolved in toluene (15 ml) in a 100 ml 3-necked round bottomed flask equipped with a glass gas
25 inlet tube and a reflux condenser. PEG 1500 (3.06g, 2.04 mmol) was added and the mixture heated at 60°C for 22 hours, cooled to room temperature and the solvent removed under reduced pressure to give the title compound (4.12g) as a white wax.
30

ab) Extended polymer from PEG 1500 and ethylidene bis[16-(5-chlorocarbonylpentanoyloxy)hexadecanoate] (multiblock)

35

The reaction was performed as in Example 2(aa), but with ethylidene bis[16-(5-chlorocarbonylpentanoyloxy)-

- 36 -

hexadecanoate (1.02g, 1.18 mmol) in toluene (20 ml) and PEG 1500 (1.77g, 1.18 mmol) to give the title compound (2.29g) as a white wax.

- 5 ac-af) Extended polymer of PEG, adipic acid and ethylidene bis(16-hydroxyhexadecanoate) (random multiblock)

10 A solution of PEG 2000 (A) (4.14g, 2.07 mmol) in 1,1,2-trichloroethylene (26 ml) was added via a syringe to a round bottomed flask containing ethylidene bis(16-hydroxyhexadecanoate) (B) (118 mg, 0.207 mmol), under nitrogen atmosphere. The resulting mixture was heated to 60°C, and when a clear solution had been obtained, 15 adipoyl chloride (C) (417 mg, 2.277 mmol) was added via a syringe. The pressure was reduced to 250 mbar and the solution was stirred at 60°C over a period of 92 hours. Remaining hydrogen chloride, evolved in the reaction, and the solvent were removed on a rotatory evaporator at 20 reduced pressure and 60°C for 3 hours, and subsequently under vacuum (<0.1mm Hg) at 60°C for 24 hours. Finally, the polymer was precipitated from an acetone solution by adding petroleum ether, and cooling in an ice bath for 2 hours. Filtration yielded 3.5g of the polymer as a 25 white waxy solid.

In total four different block copolymers differing in the molecular weight of the starting PEGs were prepared by this method; the conditions specific for each 30 polymerisation are given in Table 3 below. ¹³C NMR- and ¹H NMR-spectra of the polymers was in agreement with the expected products.

- 37 -

1) The letters refers to the reactants as specified in the text above.

ag) PEG 2300 methyl ether 16-hexadecanoyloxyhexadecanoate

PEG 2300 methyl ether (10.000g, 4.35 mmol) was dissolved in tetrahydrofuran (90 ml) and pyridine (0.413g, 5.22 mmol) was added. 16-hexadecanoyloxyhexadecanoyl chloride (2.301g, 4.35 mmol) was dissolved in tetrahydrofuran (10 ml) and added dropwise. After stirring for 3 days at room temperature, the mixture was filtered and the solvent was evaporated under reduced pressure. The residue (12.08g) was purified on a silica column, eluted with chloroform with increasing methanol concentration (from 1% to 3% methanol in chloroform) to give 5.20g (43%) of the title compound. ¹H NMR (300 MHz, CDCl₃): δ 0.80-0.87 (m, CH₃), 1.21 (s, (br), CH₂), 1.53-1.62 (m, CH₂), 2.20-2.35 (m, CH₂CO), 3.34 (s, CH₃O), 3.61 (s, OCH₂CH₂O), 4.02 (t, COOCH₂CH₂O), 4.19 (t, COOCH₂CH₂O). ¹³C NMR (75 MHz, CDCl₃): δ 13.95, 22.49, 24.71, 24.83, 25.74, 28.45, 28.95, 29.07, 29.16, 29.28, 29.34, 29.40, 29.46, 31.72, 34.05, 34.21, 58.85, 63.15, 64.19, 69.01,

- 38 -

70.37, 71.73, 173.64, 173.82.

ah) PEG 5000 methyl ether 16-hexadecanoyloxy-hexadecanoate

5

PEG 5000 methyl ether (7.500g, 1.50 mmol) was dissolved in toluene (90 ml) and dried by refluxing in a Dean Stark apparatus. Pyridine (0.143g, 1.80 mmol) was added followed by addition (dropwise) of 16-hexadecanoyloxy-hexadecanoyl chloride (1.191g, 2.25 mmol) dissolved in toluene (10 ml). The mixture was heated to reflux and after stirring under reflux for 3 days the mixture was cooled to room temperature and precipitated into hexane. After filtering, the precipitate was washed with hexane and dried (MgSO₄). After evaporation under reduced pressure, the residue was purified on a silica column, eluted with chloroform with increasing methanol concentration (from 1% to 3% methanol in chloroform) to give 5.93g (72%) of the title compound. ¹H NMR (300 MHz, CDCl₃): δ 0.82-0.86 (m, CH₃), 1.22 (s, (br), CH₂), 1.53-1.62 (m, CH₂), 2.20-2.35 (m, CH₂CO), 3.34 (s, CH₃O), 3.61 (s, OCH₂CH₂O), 4.01 (t, COOCH₂CH₂O), 4.18 (t, COOCH₂O). ¹³C NMR (75 MHz, CDCl₃): δ 13.66, 22.21, 24.43, 24.54, 25.46, 28.17, 28.67, 28.79, 28.87, 28.99, 29.06, 29.11, 29.17, 31.44, 33.73, 33.93, 58.57, 62.87, 63.90, 68.72, 69.62, 69.86, 70.09, 71.45, 76.85, 173.35, 173.53.

25

ai) PEG 10000 methyl ether 16-hexadecanoyloxyhexadecanoate

30

PEG 10000 methyl ether (7.500g, 0.75 mmol) was dissolved in toluene (140 ml) and pyridine (0.107g, 1.35 mmol) was added. The solution was heated to 60°C and 16-hexadecanoyloxyhexadecanoyl chloride (0.595g, 1.12 mmol) dissolved in toluene (10 ml) was added dropwise. The mixture was heated to reflux and after stirring under reflux for 3 days the mixture was cooled to room

35

- 39 -

temperature and precipitated into hexane. After filtering, the precipitate was washed with hexane and dried. Flash chromatography on a silica column, eluted with 5% methanol in chloroform, gave 5.39g (68%) of the title compound. ^1H NMR (300 MHz, CDCl_3): δ 0.84 (t, CH_3), 1.21 (s, (br), CH_2), 1.55-1.60 (m, CH_2), 2.20-2.35 (m, CH_2CO), 3.34 (s, CH_3O), 3.61 (s, $\text{OCH}_2\text{CH}_2\text{O}$), 4.01 (t, $\text{COOCH}_2\text{CH}_2\text{O}$), 4.18 (t, $\text{COOCH}_2\text{CH}_2\text{O}$). ^{13}C NMR (75 MHz, CDCl_3): δ 13.94, 22.48, 24.70, 24.82, 25.73, 28.94, 29.05, 29.14, 29.26, 29.33, 29.39, 29.45, 31.71, 34.00, 58.84, 63.14, 68.99, 69.36, 69.86, 69.97, 70.01, 70.36, 70.74, 70.82, 70.86, 71.72, 77.10, 173.62, 173.80.

aj) 16-[(ω -Methoxy-PEG 2000-carbonyloxy)hexadecanoic acid 1-[16-(16-hexadecanoyloxyhexadecanoyloxy)-hexadecanoyloxy]ethyl ester

Methoxy PEG 2000 chloroformate (1.90g, 0.95 mmol) was dissolved in toluene (90 ml), and pyridine (0.09g, 1.13 mmol) was added. 1[[16-(16-hexadecanoyloxy-hexadecanoyloxy)hexadecanoyloxy]ethyl 16-hydroxyhexadecanoate (1.00g, 0.95 mmol) was dissolved in toluene (10 ml) and added dropwise. The mixture was heated to reflux and after stirring under reflux for 10 hours, the mixture was cooled to room temperature and filtered. The solvent was evaporated under reduced pressure. The residue was purified on a silica column using chloroform containing 2% methanol, to give 1.00g (35%) of the title compound. ^1H -NMR (300 MHz, CDCl_3): δ 0.85 (t, CH_3), 1.20-1.33 (m, CH_2), 1.45 (d, $-\text{O}-\text{CH}(\text{CH}_3)-\text{O}$), 1.5-1.7 (m, CH_2), 2.0 (H_2O), 2.2-2.3 (m, $-\text{CH}_2-\text{C}(\text{O})-\text{O}$), 3.35 (s, CH_3-O), 3.5-3.7 (s, $-\text{OCH}_2\text{CH}_2\text{O}-$), 4.03 (t, $-\text{C}(\text{O})-\text{O}-\text{CH}_2-$), 4.10 (t, $-\text{CH}_2-\text{O}-\text{C}(\text{O})-\text{O}-$), 4.26 (m, $-\text{O}-\text{C}(\text{O})-\text{O}-\text{CH}_2-\text{CH}_2-\text{O}-$), 6.8-6.9 (q, $-\text{O}-\text{CH}(\text{CH}_3)-\text{O}$). ^{13}C -NMR (75 MHz, CDCl_3): δ 13.7, 19.2, 22.1, 24.2, 24.6, 25.2, 25.5, 28.2-29.2, 31.5, 33.9, 34.0, 58.7, 64.0, 66.3, 67.9, 68.5, 70.0, 71.5,

- 40 -

87.9, 171.5, 173.7.

- ak) 16-[ω-Methoxy PEG 5000 carbonyloxy]hexadecanoic
acid 1-[16-(16-hexadecanoyloxyhexadecanoyloxy)-
5 hexadecanoyloxy]ethyl ester

Methoxy PEG 5000 chloroformate (8.50g, 1.70 mmol) was dissolved in toluene (90 ml) and pyridine (0.146g, 1.85 mmol) was added. 1-[16-(16-Hexadecanoyloxyhexadecanoyloxy)ethyl 16-hydroxyhexadecanoate (1.79g, 1.70 mmol) was dissolved in toluene (10 ml) and added dropwise. The mixture was heated to reflux and after stirring under reflux for 3 days the mixture was cooled to room temperature and filtered. The solvent was evaporated under reduced pressure and the residue was purified on a silica column, eluted with chloroform with increasing methanol concentration (from 3% to 5% methanol in chloroform) to give 3.90g (38%) of the title compound. ¹H-NMR (300 MHz, CDCl₃): δ 0.85 (t, CH₃), 1.20-1.33 (m, CH₂), 1.45 (d, -O-CH(CH₃)-O), 1.5-1.7 (m, CH₂), 1.8 (H₂O), 2.2-2.3 (m, -CH₂-C(O)-O), 3.35 (s, CH₃-O-), 3.5-3.7 (s, -OCH₂CH₂O-), 4.03 (t, -C(O)-O-CH₂-), 4.10 (t, -CH₂-O-C(O)-O-), 4.26 (m, -O-C(O)-O-CH₂-CH₂-O-), 6.8-6.9 (q, -O-CH(CH₃)-O).

- al) 16-[ω-Methoxy PEG 10000 carbonyloxy]hexadecanoic
acid 1-[16-(16-hexadecanoyloxyhexadecanoyloxy)
30 hexadecanoyloxy]ethyl ester

Methoxy PEG 10000 chloroformate (7.50g, 0.75 mmol) was dissolved in toluene (90 ml), and pyridine (0.063g, 0.80 mmol) was added. 1-[16-(16-Hexadecanoyloxyhexadecanoyloxy)ethyl 16-hydroxyhexadecanoate (0.79g, 0.75 mmol) was dissolved in toluene (10 ml) and added dropwise. The mixture was heated to reflux and after stirring under reflux for 3 days the mixture was cooled

- 41 -

to room temperature and filtered. The solvent was evaporated off under reduced pressure. The residue was purified on a silica column, eluted with chloroform with increasing methanol concentration (from 3% to 5% methanol in chloroform) to give 1.60g (19%) of the title compound. ¹H-NMR (300 MHz, CDCl₃): δ 0.85 (t, CH₃), 1.20-1.33 (m, CH₂), 1.45 (d, -O-CH(CH₃)-O), 1.5-1.7 (m, CH₂), 2.2-2.3 (m, -CH₂-C(O)-O), 3.35 (s, CH₃-O-), 3.5-3.7 (s, -OCH₂CH₂O-), 4.03 (t, -C(O)-O-CH₂), 4.10 (t, -CH₂-O-C(O)-O-), 4.26 (m, -O-C(O)-O-CH₂-CH₂-O-), 6.8-6.9 (q, -O-CH(CH₃)-O).

EXAMPLE 3 - Preparation of polymer particles

15

a-e) General procedure

A solution of copolymer in toluene was prepared. This solution was added to water (25-30% toluene v/v) and mixed with a high speed mixer (20500 rpm for 40 to 60 seconds). The resultant emulsion was freeze dried resulting in a fine white powder.

g) Particles from block copolymer of methylene bis(16-hydroxyhexadecanoate), adipoyl chloride and α -hydroxy- ω -methoxy PEG 2000

10

The polymer of Example 2(i) (0.1g) was dissolved in 1.9g toluene and mixed for one minute with 3 ml water using an Ystral mixer at 10,000 rpm to form a water-in-oil emulsion. The water-in-oil emulsion was then emulsified in water (3 ml) to form a water-in-oil-in-water emulsion, which was freeze dried to give air-filled particles.

15

r) Particles from block copolymer of methylene bis(16-hydroxyhexadecanoate), adipoyl chloride and α -hydroxy- ω -methoxy PEG 2000

20

The procedure of Example 3(q) was repeated except that the second water phase of the water-in-oil-in-water emulsion contained 2% gelatin.

25

- 45 -

s) Preparation of microbubbles of extended polymer from Example 2(ab) filled with perfluoro-n-butane (by shaking)

5 Polymer from Example 2(ab) (0.02g) was dissolved in distilled water (1 ml). The solution was degassed, and the headspace of the vessel was filled with perfluoro-n-butane. The solution was shaken for 18 seconds on a Capmix®. Perfluoro-n-butane-filled microbubbles of a
10 size suitable for intravenous administration were observed by microscopy. The microbubbles were stable for several days.

t) Preparation of microbubbles of extended polymer from Example 2(ab) filled with perfluoro-n-butane (by sonicating)

Polymer from Example 2(ab) (0.25g) was dissolved in distilled water (5 ml). The solution was degassed and
20 then treated with a sonicator for 1 minute under a stream of perfluoro-n-butane. Perfluoro-n-butane-filled microbubbles of a size suitable for intravenous administration were observed in a microscope. The microbubbles were stable for several days.

25

u) Preparation of microbubbles of extended polymers from Examples 2(ab) and 2(ai) filled with perfluoro-n-butane (by shaking)

30 Polymer from Example 2(ab) (0.01g) was dissolved in distilled water (0.5 ml) and added to 0.5 ml of an aqueous solution (1%) of the polymer from Example 2(ai). The solution was degassed, and the headspace of the vessel was filled with perfluoro-n-butane and shaken for
35 99 seconds on a Capmix®. Perfluoro-n-butane-filled microbubbles of a size suitable for intravenous administration were observed in a microscope. The

- 46 -

microbubbles were stable for several days.

v) Preparation of microbubbles of Hypermer B246 filled with perfluoro-n-butane (by shaking)

5

Hypermer B246® (0.01g) (ICI) was dissolved in 1 ml of a solution of 4.1% (weight) glycerol and 1.4% (weight) propylene glycol in water. The sample was degassed, and the headspace of the vessel filled with perfluoro-n-butane and shaken for 99 seconds on a Capmix®. Stable perfluoro-n-butane-filled microbubbles of a size suitable for intravenous administration were observed in a microscope.

15

EXAMPLE 4 - Acoustic characterisations (in-vitro)

General procedure

20 The samples were re-dispersed in MilliQ™ water by shaking on a laboratory shaker for an appropriate time. The dispersions were then observed by light microscopy to determine the particle size.

25

The particles were characterised by measuring the ultrasonic transmission through aqueous dispersions of the particles using a 3.5 MHz broad band transducer in a pulse-reflection technique. The aqueous solvent was used as a reference.

Claims

1. A contrast agent comprising gas microbubbles encapsulated by a non-polymerisable wall-forming block or graft copolymer surfactant.
2. A contrast agent as claimed in claim 1 wherein the copolymer surfactant contains one or more hydrophilic regions or domains and one or more hydrophobic regions or domains.
3. A contrast agent as claimed in claim 2 wherein the copolymer surfactant contains one or more hydrophilic regions or domains selected from polysaccharides, polyalcohols, polyvinylpyrrolidones, polyethylene glycols and polyaminoacids.
4. A contrast agent as claimed in claim 3 wherein the copolymer surfactant contains one or more hydrophilic regions or domains consisting essentially of polyethylene glycol units.
5. A contrast agent as claimed in any of claims 2 to 4 wherein the copolymer surfactant contains one or more hydrophobic regions or domains selected from poly(meth)acrylate esters, polyorthoesters, vinylic and styrenic polymers, polyacetals, polyanhydrides, polylactic acids, polyglycolic acids and ethers and esters thereof, and polylactic acid/polyglycolic acid copolymers.
6. A contrast agent as claimed in any of claims 2 to 4 wherein the copolymer surfactant contains one or more hydrophobic regions or domains selected from polyester groups containing one or more long chain aliphatic groups.

- 50 -

7. A contrast agent as claimed in claim 6 wherein said long chain aliphatic group or groups are selected from polymethylene groups containing 10-20 carbon atoms.
8. A contrast agent as claimed in any of the preceding claims wherein the copolymer surfactant is a block copolymer.
9. A contrast agent as claimed in claim 8 wherein the copolymer surfactant is an extended polymer.
10. A contrast agent as claimed in claim 9 wherein said extended polymer comprises hydrophilic polymer blocks linked by oligomeric or quasi-polymeric hydrophobic regions or domains.
11. A contrast agent as claimed in any of the preceding claims wherein the copolymer surfactant is biodegradable.
12. A contrast agent as claimed in claim 11 wherein the copolymer surfactant contains acid-labile bonds.
13. A contrast agent as claimed in claim 11 wherein the copolymer surfactant contains biodegradable linkages of formula

(where R^1 and R^2 each represent a hydrogen atom or a carbon-attached monovalent organic group or R^1 and R^2 together form a carbon-attached divalent organic group, and m and n are each zero or 1).

14. A contrast agent as claimed in claim 13 wherein R^1 and R^2 (when other than hydrogen) are selected from aliphatic groups having up to 10 carbon atoms,

- 51 -

cycloalkyl groups having up to 10 carbon atoms, araliphatic groups having up to 20 carbon atoms, aryl groups having up to 20 carbon atoms, heterocyclic groups having up to 20 carbon atoms and one or more heteroatoms selected from O, N and S, and any of the preceding groups carrying one or more functional substituents.

15. A contrast agent as claimed in claim 14 wherein R^1 and R^2 are selected from hydrogen atoms and methyl groups.

16. A contrast agent as claimed in any of claims 13 to 14 wherein the copolymer surfactant comprises one or more hydrophobic regions or domains containing units of formula (I).

17. A contrast agent as claimed in any of claims 13 to 14 wherein the copolymer surfactant comprises one or more hydrophilic regions or domains containing units of formula (I).

18. A contrast agent as claimed in any of the preceding claims further comprising at least one additional emulsifier.

19. A contrast agent as claimed in claim 18 containing at least one emulsifier selected from fatty acids and carbohydrate and triglyceride esters thereof, phospholipids, proteins, polyethylene glycols and block copolymers.

20. A contrast agent as claimed in any of the preceding claims which is coated with one or more coating materials selected from polyethylene glycols, proteins and polysaccharides.

21. A contrast agent as claimed in any of the preceding

some of the claim is missing.

- 52 -

air, nitrogen, oxygen, hydrogen, nitrous oxide, carbon dioxide, helium, argon, sulphur hexafluoride and low molecular weight optionally fluorinated hydrocarbons.

22. A contrast agent as claimed in claim 21 wherein the encapsulated gas is perfluorobutane or perfluoropentane.

23. Use of a contrast agent as defined in any of claims 1 to 22 in diagnostic imaging.

24. Use of a contrast agent as defined in any of claims 1 to 22 in diagnostic ultrasonic imaging.

25. Use of a contrast agent as defined in any of claims 1 to 22 in magnetic resonance imaging.

26. A method of generating enhanced images of a human or non-human animal body which comprises administering to said body a contrast agent as defined in any of claims 1 to 22 and generating an ultrasound or MR image of at least a part of said body.

27. A process for the preparation of a contrast agent as claimed in claim 1 which comprises interacting a gas with a non-polymerisable wall-forming block or graft copolymer surfactant so as to produce said contrast agent.

28. A process as claimed in claim 27 which comprises (i) generating an emulsion comprising hydrophilic and hydrophobic phases wherein the copolymer surfactant is preferentially solubilised in the dispersed phase thereof or is distributed about the interfaces between said phases and (ii) obtaining said contrast agent from said emulsion.

- 53 -

29. A process as claimed in claim 28 wherein a multiple emulsion is prepared, the copolymer surfactant being preferentially solubilised in or distributed about the interfaces of the finest dispersed phase.

30. A process as claimed in claim 28 or 29 carried out in the presence of at least one additional emulsifier.

31. A process as claimed in claim 30 carried out in the presence of at least one emulsifier selected from fatty acids and carbohydrate and triglyceride esters thereof, phospholipids, proteins, polyethylene glycols and block copolymers.

32. A process as claimed in claim 31 carried out in the presence of a poly(oxyethylene)-poly(oxypropylene)-poly(oxyethylene) block copolymer.

33. A process as claimed in any of claims 28 to 32 wherein the emulsion is lyophilised in the presence of the gas to be encapsulated.

34. A process as claimed in any of claims 27 to 33 wherein the contrast agent is coated with one or more coating materials selected from polyethylene glycols, proteins and polysaccharides.

35. A process as claimed in claim 28 wherein the dispersed phase is gaseous and the copolymer surfactant is preferentially soluble in the dispersion phase, thereby generating a contrast agent comprising a dispersion of gas microbubbles stabilised by encapsulating copolymer surfactant.

36. A process as claimed in claim 35 wherein the dispersed phase is a perfluoroalkane and the dispersion phase is an aqueous solution of a water-soluble

- 54 -

copolymer surfactant.

37. A block or graft copolymer surfactant containing biodegradable linkages of formula

(where R^1 and R^2 each represent a hydrogen atom or a carbon-attached monovalent organic group or R^1 and R^2 together form a carbon-attached divalent organic group, and m and n are each zero or 1).

38. A copolymer surfactant as claimed in claim 37 wherein R^1 and R^2 (when other than hydrogen) are selected from aliphatic groups having up to 10 carbon atoms, cycloalkyl groups having up to 10 carbon atoms, araliphatic groups having up to 20 carbon atoms, aryl groups having up to 20 carbon atoms, heterocyclic groups having up to 20 carbon atoms and one or more heteroatoms selected from O, N and S, and any of the preceding groups carrying one or more functional substituents.

39. A copolymer surfactant as claimed in claim 38 wherein R^1 and R^2 are selected from hydrogen atoms and methyl groups.

40. A copolymer surfactant as claimed in claim 39 wherein R^1 represents a hydrogen atom and R^2 represents a methyl group.

41. A copolymer surfactant as claimed in any of claims 37 to 40 containing one or more hydrophilic regions or domains and one or more hydrophobic regions or domains.

42. A copolymer surfactant as claimed in claim 41 containing one or more hydrophilic regions or domains selected from polysaccharides, polyalcohols, polyvinyl-

- 55 -

pyrrolidones, polyethylene glycols and polyaminoacids.

43. A copolymer surfactant as claimed in claim 42 containing one or more hydrophilic regions or domains consisting essentially of polyethylene glycol units.

44. A copolymer surfactant as claimed in any of claims 41 to 43 containing one or more hydrophobic regions or domains selected from poly(meth)acrylate esters, polyorthoesters, vinylic and styrenic polymers, polyacetals, polyanhydrides, polylactic acids, polyglycolic acids and ethers and esters thereof, and polylactic acid/polyglycolic acid copolymers.

45. A copolymer surfactant as claimed in any of claims 41 to 43 containing one or more hydrophobic regions or domains selected from polyester groups containing one or more long chain aliphatic groups.

46. A copolymer surfactant as claimed in claim 45 wherein said long chain aliphatic group or groups are selected from polymethylene groups containing 10-20 carbon atoms.

47. A copolymer surfactant as claimed in any of claims 37 to 46 which is a block copolymer.

48. A copolymer surfactant as claimed in claim 47 which is an extended polymer.

49. A copolymer surfactant as claimed in claim 48 comprising hydrophilic polymer blocks linked by oligomeric or quasi-polymeric hydrophobic domains or regions.

50. A copolymer surfactant as claimed in any of claims 41 to 49 wherein one or more hydrophobic regions or

- 56 -

domains contain units of formula (I) as defined in claim 37.

51. A copolymer surfactant as claimed in any of claims 41 to 44 wherein one or more hydrophilic regions or domains are water-insoluble and contain units of formula (I) as defined in claim 37.

52. A copolymer surfactant as claimed in any of claims 37 to 51 containing units of formula

(where R^1 , R^2 , m and n are as defined in claim 37 and a and b are each integers in the range 1-30).

53. A copolymer surfactant as claimed in claim 52 wherein a and b in formula (II) are each integers in the range 10-18.

54. An emulsion comprising a copolymer surfactant as claimed in any of claims 37 to 53 comprising hydrophilic and hydrophobic phases wherein the copolymer surfactant is preferentially solubilised in the dispersed phase thereof or is distributed about the interfaces between said phases.

55. Use of a copolymer surfactant as claimed in any of claims 37 to 53 or an emulsion thereof as claimed in claim 54 in drug formulations, drug delivery systems, contrast agents, surgical materials, biocompatible implant surfaces, particle coatings, foods, paints, coatings, impregnations, cosmetics, detergents, textiles, coating of medical devices, biodegradable clear packaging film, polymer property modifiers, self-lubricating materials, compatibilisers for polymer blends, separation membranes, anti-fouling coatings,

- 57 -

foam forming materials, antifoams, phase transfer catalysts, thermoplastic elastomers or the manufacture of hydrogels.

INTERNATIONAL SEARCH REPORT

International Application No
PCT/GB 94/01923

A. CLASSIFICATION OF SUBJECT MATTER
IPC 6 B01F17/00 A61K49/00

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 6 A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP,A,0 535 534 (EASTMAN KODAK COMPANY) 7 April 1993 see claims; examples ---	1-55
X	EP,A,0 458 745 (SINTETICA S.A.) 27 November 1991 see claims; examples ---	1-55

☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents:

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

T later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

X document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

Y document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

Z document member of the same patent family

INTERNATIONAL SEARCH REPORT

International application No.

PCT/GB94/01923

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 26
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claim 26 is directed to a method of treatment of
the human/animal body, the search has been carried out and based on
the alleged effects of the compound/composition.
2. ☒ Claims Nos.: 1-55
because they relate to parts of the international application that do not comply with the prescribed requirements to such
an extent that no meaningful international search can be carried out, specifically:
see annex
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
